

Name: Rohan Sharma
Roll No: 14

1. The green pigment is Chlorophyll. It helps plants to take sunlight and make food by water and air.
2. Normal body temperature is 37°C . In Fahrenheit it is 98.4°F .
3. Copper is cheaper and looks shiny so they put it on the bottom of steel pans.
4. Autotrophs are living things that make their own food, like green grass and trees. Heterotrophs cannot make food and eat autotrophs, like cow and lion.
5. When an acid and a base mix together, they cancel each other. This is neutralization. Example: Mixing Lemon juice with water.
6. Stomach is like a J shaped bag. Food stays there for 2-3 hours. The stomach releases hydrochloric acid to kill germs and make the food soft. It also has digestive juices which breaks down carbohydrates into

7. Physical Change:

1. No new substance is formed.
2. It is reversible.

Example: Melting of ice.

Chemical Change:

1. New substance is made.
2. It is permanent.

Example: Boiling of water.

8. Stomata are tiny holes present below the leaf.

They take in oxygen for photosynthesis and give out carbon dioxide. They also remove extra water as vapor which is called transpiration.

9. Breathing has two steps - Breathing in and Breathing out.

- Inhalation: When we take air in, our chest expands. The ribs move outwards and upwards. The diaphragm moves down (becomes flat). So lungs get bigger and air enters.

- Exhalation: When we give air out, ribs move down and inward. The diaphragm moves up

to its normal dome shape. Lungs become small and bad air is pushed out.

10. 1. Conduction: Transfer of heat in solids from hot end to cold end without actual movement of particles. Example: A metal spoon getting hot in hot tea.
2. Convection: Heat moves in air and liquids when hot liquid goes up and cold liquid comes down. Example: Sea breeze and land breeze.
3. Radiation: Heat comes directly without any medium. Example: Heat coming from sun to Earth.
